JBI Manual for Evidence Implementation

Welcome to the JBI Manual for Evidence Implementation

The JBI Manual for Evidence Implementation is intended to provide an overview of JBI-endorsed approaches to getting evidence into practice. There are many different approaches that can be used to implement evidence into healthcare or community settings. This handbook covers some of the approaches utilised within JBI that can inform clinicians striving to get evidence into practice.

In particular, this manual is aimed at participants undertaking the JBI Evidence Implementation Training Program (formerly Evidence-based Clinical Fellowship Program) and health professionals and organisations wanting to implement evidence into practice. The manual serves as both a resource to contribute to the field of implementation science and as a practical guide for those who are currently undertaking or planning to undertake an evidence implementation project.

This manual intends to cover the broad spectrum of evidence implementation approaches. The first introductory section situates implementation science within the broader evidence-based healthcare (EBHC) context. This section explains in detail the JBI Model of Evidence-based Healthcare and our approach to evidence implementation from a theoretical perspective, while highlighting some key elements that we deem critical for any evidence implementation activity.

The following sections cover the various approaches that JBI currently uses and endorses for evidence implementation. Section 2 of the manual provides a detailed guide for evidence implementation projects using an audit and feedback approach informed by the JBI Implementation Framework as seen in the JBI Evidence Implementation Training Program (formerly Evidence-based Clinical Fellowship Program).

In the future, additional sections will be included, such as using a guideline development/adaptation process, as seen in clinical decision support systems, action research and journal clubs.

Table of Contents

- About this Manual
- Contributors
- Section 1: An introduction to evidence implementation
  - Section 1 Introduction
  - The emerging field of implementation science
  - The JBI Model of Evidence-based Healthcare: Evidence Implementation
    - Context analysis
    - Facilitation of change
    - Evaluation of process and outcome
- Section 2: Evidence implementation projects using an evidence-based audit and feedback approach: the JBI Implementation Framework
  - Section 2 Introduction
  - Step 1: Identify the practice area
  - Step 2: Engage change agents
  - Step 3: Assess context and readiness to change
  - Step 4: Review practice against evidence-based audit criteria
  - Step 5: Implement changes to practice using GRiP
  - Step 6: Re-assess practice using a follow-up audit
  - Step 7: Consider sustainability of the project
  - Conclusion
